### SOME IMPORTANT RESULTS/CONCEPTS

**\*\* A relation  $R$  in a set  $A$  is called**

(i) *reflexive*, if  $(a, a) \in R$ , for every  $a \in A$ ,

(ii) *symmetric*, if  $(a_1, a_2) \in R$  implies that  $(a_2, a_1) \in R$ , for all  $a_1, a_2 \in A$ .

(iii) *transitive*, if  $(a_1, a_2) \in R$  and  $(a_2, a_3) \in R$  implies that  $(a_1, a_3) \in R$ , for all  $a_1, a_2, a_3 \in A$ .

**\*\* Equivalence Relation :**  $R$  is equivalence if it is reflexive, symmetric and transitive.

**\*\* Function :** A relation  $f : A \rightarrow B$  is said to be a function if every element of  $A$  is correlated to unique element in  $B$ .

\*  $A$  is domain

\*  $B$  is codomain

\* For any  $x$  element  $x \in A$ , function  $f$  correlates it to an element in  $B$ , which is denoted by  $f(x)$  and is called image of  $x$  under  $f$ . Again if  $y = f(x)$ , then  $x$  is called as pre-image of  $y$ .

\* Range =  $\{f(x) \mid x \in A\}$ . Range  $\subseteq$  Codomain

\* The largest possible domain of a function is called domain of definition.

**\*\* Composite function :**

Let two functions be defined as  $f : A \rightarrow B$  and  $g : B \rightarrow C$ . Then we can define a function

$\phi : A \rightarrow C$  by setting  $\phi(x) = g\{f(x)\}$  where  $x \in A$ ,  $f(x) \in B$ ,  $g\{f(x)\} \in C$ . This function

$\phi : A \rightarrow C$  is called the composite function of  $f$  and  $g$  in that order and we write.  $\phi = g \circ f$ .

**\*\* Different type of functions :** Let  $f : A \rightarrow B$  be a function.

\*  $f$  is **one to one (injective) mapping**, if any two different elements in  $A$  is always correlated to different elements in  $B$ , i.e.  $x_1 \neq x_2 \Rightarrow f(x_1) \neq f(x_2)$  or,  $f(x_1) = f(x_2) \Rightarrow x_1 = x_2$

\*  $f$  is **many one mapping**, if  $\exists$  at least two elements in  $A$  such that their images are same.

\*  $f$  is **onto mapping** (surjective), if each element in  $B$  is having at least one preimage.

\*  $f$  is **into mapping** if  $\text{range} \subseteq \text{codomain}$ .

\*  $f$  is **bijective mapping** if it is both *one to one and onto*.

**\*\* Binary operation :** A binary operation  $*$  on a set  $A$  is a function  $*$  :  $A \times A \rightarrow A$ . We denote  $*(a, b)$  by  $a * b$ .

\* A binary operation  $*$  on  $A$  is a rule that associates with every ordered pair  $(a, b)$  of  $A \times A$  a unique element  $a * b$ .

\* An operation  $*$  on  $a$  is said to be commutative iff  $a * b = b * a \forall a, b \in A$ .

\* An operation  $*$  on  $a$  is said to be associative iff  $(a * b) * c = a * (b * c) \forall a, b, c \in A$ .

\* Given a binary operation  $*$  :  $A \times A \rightarrow A$ , an element  $e \in A$ , if it exists, is called **identity** for the operation  $*$ , if  $a * e = a = e * a, \forall a \in A$ .

\* Given a binary operation  $*$  :  $A \times A \rightarrow A$  with the identity element  $e$  in  $A$ , an element  $a \in A$  is said to be **invertible** with respect to the operation  $*$ , if there exists an element  $b$  in  $A$  such that  $a * b = e = b * a$  and  $b$  is called the **inverse of  $a$**  and is denoted by  $a^{-1}$ .
